

Design Phase

The design phase focuses on planning the structure and workflow of the automated ticket assignment system. In this phase, the system components and processes are designed to ensure that support tickets are properly routed to the appropriate teams in an efficient manner.

The system is designed using the ServiceNow platform, where different modules such as Users, Groups, Roles, and Assignment Rules are configured. These components work together to automate the ticket routing process and reduce manual intervention.

System Design

The system consists of the following components:

1. User Management

Users are created in the ServiceNow platform to represent the support staff. Each user will have login credentials and will be responsible for handling assigned tickets.

2. Group Management

Support groups are created based on different technical departments such as Network Support, Software Support, and Hardware Support. Users are assigned to these groups according to their expertise.

3. Role Assignment

Roles are assigned to users to define their permissions and access levels within the system. For example, some users may have permission to view tickets, while others may have permission to manage and resolve tickets.

4. Ticket Assignment Rules

Assignment rules are designed to automatically route tickets to the appropriate support groups based on specific conditions such as issue category, priority, or service type.

Workflow Design

1. A user raises a support ticket in the system.
2. The system checks the ticket details such as category or issue type.
3. Based on the assignment rules, the ticket is automatically routed to the appropriate support group.
4. A support team member from that group receives the ticket and works on resolving the issue.

Outcome

The designed system ensures that support tickets are assigned automatically to the correct teams, which reduces delays, improves efficiency, and enhances customer satisfaction.
