

Implementation Phase

Introduction

The implementation phase focuses on developing and configuring the automated ticket routing system in ServiceNow. In this phase, users are created, roles are assigned, and necessary configurations are implemented to ensure that support tickets are automatically routed to the appropriate teams. This helps reduce manual effort and improves efficiency in handling support requests.

Milestone 1: Users

Activity 1: Create Users

In this activity, user accounts are created in the ServiceNow platform. These users represent the support staff who will handle the incoming support tickets. Creating users ensures that each support member has access to the system and can manage assigned tickets effectively.

Steps to Create Users:

1. Open the **ServiceNow platform** and log in with administrator credentials.
2. Navigate to the **User Administration** module.
3. Click on **Users**.
4. Select **New** to create a new user account.
5. Enter the required details such as:
 - Name
 - User ID
 - Email address
 - Department
 - Role
6. Click **Submit** to save the user details.

After creating users, they can be assigned to specific support groups so that the automated ticket routing system can direct tickets to the appropriate team members.

Outcome

By creating users in the system, the organization ensures that all support staff members are registered within the ServiceNow platform. This step forms the foundation for further configurations such as group creation, role assignment, and automated ticket routing.

Milestone 2: Groups

Activity 2: Create Support Groups

Groups are created to organize users based on their responsibilities. Support tickets can then be assigned to the appropriate groups.

Steps:

1. In the navigation bar, type **Groups**.
2. Select **User Administration** → **Groups**.
3. Click **New**.
4. Enter the group name (Example: Network Support, Software Support).
5. Add users to the group in the **Members** section.
6. Click **Submit**.

Outcome:

Support teams are created and users are organized into groups for efficient ticket handling.

Milestone 3: Roles

Activity 3: Assign Roles

Roles define the permissions and access levels for users in the system.

Steps:

1. Navigate to **User Administration** → **Users**.
2. Open the user record.
3. Scroll to the **Roles** related list.
4. Click **Edit**.
5. Select the required roles (Example: ITIL, Admin).
6. Click **Save**.

Outcome:

Users receive appropriate permissions to access and manage tickets in the ServiceNow platform.

Milestone 4: Ticket Routing

Activity 4: Configure Ticket Assignment

Automated ticket assignment rules are configured to route tickets to the correct support group.

Steps:

1. Navigate to **System Policy** → **Assignment Rules**.
2. Click **New** to create a new rule.
3. Define the conditions for ticket assignment (Example: Category = Network Issue).
4. Assign the ticket to the relevant support group.
5. Click **Submit**.

Outcome:

Support tickets are automatically routed to the correct teams, reducing manual effort and improving response time.
